Local government use of data

Cardiff Council
Methodology and structure of this report

The growth of ‘big data’ strategies in the private sector and the availability of ‘open data’ has been unprecedented in recent times, and has revolutionised the way organisations make decisions. With the technology available today, and the rate of technological change, data-driven decision-making is becoming the norm rather than the exception. However, is this approach extending to local authorities in Wales?

Given these challenges, this report summarises the findings of the Wales Audit Office national study looking at whether local government has the right building blocks and culture in place to capitalise on the data that it holds.

Part 1 of this report summarises why making use of data is important and is drawn from national research with leaders in data usage in the public sector.

Part 2 - summarises the key issues from data tool responses provided by senior officers and elected members for Cardiff Council.

Part 3 - sets out some good practice examples we identified in our research which we believe can help councils make better use of their data.

The findings in Part 2 this report are drawn from and based on the collected responses to the Wales Audit Office Data Tool provided by senior officers and elected members in Cardiff Council.

Consequently, it only provides a summary of the views of those council staff and elected members who responded on how the council manages data and should be considered as useful evidence in how the council can improve its use of data.

Consequently, the report should be read alongside the national study report, which provides more detailed findings and makes a series of recommendations for all local authorities in Wales.
Part 1 – Why making better use of data is important

In a period of sustained austerity, there is a pressing need for innovation to help local authorities deliver better outcomes with decreasing resources.

Effective use of data presents huge opportunities in providing services in the face of these acute and on-going financial pressures.

However, our national study found that local authorities across Wales are slow to develop a culture that values and uses data effectively to improve services and outcomes.

Our national report – The Maturity of Local Government in Use of Data – can be viewed on our website audit.wales.

The benefits of making better use of data

Being smart and strategic in using data brings many benefits for local authorities, their partners, the communities they work in and the citizens they serve.
Why making better use of data is important for local authorities

- It supports local authorities to make better use of resources and become more efficient
- It provides insight into what works well and why
- It's good for democracy as decisions are evidence-based, open and transparent
- It supports better and quicker decision-making by identifying trends and insights
- It helps integration and collaboration between partners
- It helps improve service quality, reach and impact
- It supports transformation moving from reacting to preventing problems
- It supports collaboration, integration and partnership working
Our national report on the use of data identifies seven key components in making better use of data

From our work, we have identified what we consider to be the key aspects of how well local authorities use data and have set these out in the following table. Overall, we conclude that most authorities are characterised by the descriptors at level 1 and level 2.

<table>
<thead>
<tr>
<th>Key Characteristic</th>
<th>Level 1</th>
<th>Level 2</th>
<th>Level 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leadership</td>
<td>Leadership on data and organisational culture encourages a risk averse approach, which does not value or seek to maximise data usage.</td>
<td>Leaders recognise the value of streamlining and improving use of data, both within the Local Authority and with partners. The culture in most of the Authority has not progressed from ‘identifying’ the opportunities of integrating and sharing data to actually ‘doing’ it.</td>
<td>The organisation has a strong leadership culture based on transparency and valuing and using data to underpin decisions. The Authority openly shares data and insights with citizens, partners and stakeholders setting out the rationale for choices. Data is valued and used across the Authority.</td>
</tr>
<tr>
<td>Corporate Standards</td>
<td>Services operate independently in silos, and define their own data requirements. The Local Authority lacks corporate standards for how services should capture and use data and little integration or sharing of data takes place internally nor externally.</td>
<td>The Local Authority knows what data is collected by services and has some linked databases, but data networking has developed organically. The Local Authority lacks data standards and whilst data sharing and integration takes place, it is in narrowly defined areas.</td>
<td>The Local Authority has corporate data standards and coding structures. The Local Authority has identified its long-term data requirements and is streamlining systems to reduce duplication and improve accessibility. Data is integrated and coding gaps when identified are addressed.</td>
</tr>
<tr>
<td>Integrated customer data</td>
<td>Service users often apply multiple times for services or assistance. Duplication of data is common and some services rely on paper based manual systems.</td>
<td>Duplication is known, but not always addressed. Some standardisation takes place, usually around established parameters such as property gazetteers, but is limited. Most data is digitised but not linked.</td>
<td>Citizens apply once, and services are configured to meet their needs. Data is entirely digitised and regularly cleansed to ensure it is accurate. Data sharing and integration is well advanced. Duplication is kept to a minimum.</td>
</tr>
<tr>
<td>Key Characteristic</td>
<td>Level 1</td>
<td>Level 2</td>
<td>Level 3</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>Data Protection</td>
<td>Data protection legislation is understood and complied with, but is a block to sharing data.</td>
<td>Data protection legislation is understood and complied with and is not seen as a block to making better use of data.</td>
<td>Data protection legislation is complied with and implementation is supporting the Local Authority to appropriately share data internally and with other bodies.</td>
</tr>
<tr>
<td>Data analytics</td>
<td>Investment in data analytics – segmentation analysis, forecasting and predictive analysis – is limited. There is little capacity and a deficit in skills to improve use of data. There is no or little investment in upskilling staff.</td>
<td>The need to build skills and capacity and invest in making better use of data is recognised, but not always addressed. Improving capacity and upskilling staff is a known risk but progress to address this is slow or limited.</td>
<td>Staff have been equipped in data analytics, and services regularly use data from a range of sources to understand events, predict future scenarios and model potential demand. Data analytics is recognised and valued as a core function and is resourced sufficiently.</td>
</tr>
<tr>
<td>Data Driven Decisions</td>
<td>Data is reported and performance is analysed. The focus of performance reporting is limited to Local Authority service information, is mostly historical and backward looking, and not reported in real time. Data analytics is rarely used.</td>
<td>Data is reported and performance is analysed. The Local Authority is focussing on monitoring and measuring impact. The importance of data analytics is growing but not embedded or sufficiently developed in most services.</td>
<td>Data is reported and through performance evaluation, corrective action is taken when the data shows a change in direction is needed. The Local Authority has a record of accomplishment of using data analytics to manage services and is focused on understanding future demand.</td>
</tr>
<tr>
<td>Open Data</td>
<td>The Local Authority is not using data to effectively support decision-making. Open Data and public reporting is very limited.</td>
<td>The Local Authority uses data to underpin decisions but limitations in its coverage and analysis weakens ‘real time’ choices. Open Data is produced but coverage is limited.</td>
<td>Data driven decision-making is well established and accepted as the ‘way to do things’. Open Data is made available in real time and a wide range of organisations use the information to develop new opportunities.</td>
</tr>

Making better use of data requires...

Vision, leadership & culture

Skills and capacity

Data protection

Evidence-based decisions

Better use of data
Part 2 – Summary of key issues from data tool responses for Cardiff Council

This resource summarises the position of Cardiff Council within the context of our national study findings. It also explores some of the barriers identified locally. Overcoming these barriers will help to ensure the Authority and its citizens reap the rewards of better use of data. This resource is structured around four key themes identified in our national report as vital steps in the data journey. These findings are based on an amalgamation of all the data tool responses.

**Vision, leadership & culture**

A strong data culture and data success are intertwined, and authorities cannot have one without the other. To improve the use of data, authorities need visionaries who recognise the importance of empowering people to take well-managed risks and learn from failure. Local authorities that make the best use of data perceive the wealth of data they hold as an invaluable resource and devote the appropriate monetary and human resources to ensure it is used as effectively as possible.

**Data protection**

Local authorities are often the gatekeepers of very personal and very sensitive information. They handle all sorts of data on a daily basis, covering everything from income to detailed health and care records. However, using data in the public sector is a delicate balancing act. Local authorities need to protect personal information from data misuse but without suffocating innovation. As a result, many public sector organisations are wrestling with the benefits and risks of data sharing.

**Skills & capacity**

Local authorities hold a vast resource of insight, intelligence and data that has the potential to drive efficiency, direct resource allocation and fundamentally improve the delivery of services. A mature Local Authority will use data to improve services and transform their organisation, and will have staff and Elected Members who are skilled and confident data users. Having good data analytical skills to inform and direct resource decisions is a key component of a mature approach to using data.

**Evidence-based decisions**

Data driven decision-making is an approach to governance that values decisions that are underpinned by verifiable data. However, the success of the data-driven approach is reliant upon the quality of the data gathered, the effectiveness of its analysis and interpretation, and the processes established to judge impact and performance.
Data tool responses for Cardiff Council

We ran a suite of six data tools at each of Wales’ 22 local authorities to help inform our national local government study. The data tool recipients and the response rates for Cardiff Council are set out below.

Our data tools asked questions against a range of issues relating to the use of data. Comments received shed further light on the barriers the Authority faces to make better use of data.

<table>
<thead>
<tr>

<td>171</td>
<td>57</td>
<td>33%</td>
</tr>
</tbody>
</table>
The Authority has already experienced some of the **benefits of making data-led decisions**, for example through the Secure Anonymised Information Linkage (SAIL) project, which has allowed the Authority to assess population trends and demographical patterns, by combining health and benefits data onto education and social care data. The Authority needs a **clear data vision** to gain a better insight into issues and challenges it faces. Although it holds a wealth of data, service areas can often find it difficult to extract relevant data for their requirements or lack the tools to link different datasets.

Completing a data audit to identify who holds what data, for what purpose and how it is used will help the Authority identify **how best to streamline and integrate data**. Setting corporate data management standards and coding for services’ core data will support data sharing across different teams and service areas.
What we found in Cardiff: Data protection

Local authorities’ perception of data protection regulations provide an indication of their appetite to make the best use of data; for example, are regulations perceived as ‘a barrier to data sharing’, or as ‘a framework within which data can be shared safely’? A lack of understanding of data protection regulations is a bigger contributor to risk aversion than the regulations themselves.

Data tool respondents indicated that data is managed well, data protection standards are embedded throughout the Authority, and that staff have a good understanding of their responsibilities regarding data protection legislation. Despite this, respondents also indicated that there is a general reluctance to share data between departments within the Authority, possibly down to fear of not complying with data protection legislation. To address this, the Authority should provide, at reasonable intervals, refresher training to staff to ensure they know when and what data they can and cannot share and update data sharing protocols.

One respondent cited one of their challenges as ‘not just having data for data’s sake, we should only have what we need and not waste any valuable resources capturing the unnecessary’. Corporate data collection and management standards will also improve the compatibility of different data sets, thus facilitating data sharing with other public bodies.

We asked about the awareness of local authorities’ use of personal data in a survey of 750 people across Wales…

Only 36% were satisfied that the information their Local Authority holds is used effectively to plan and provide services.

Only 12% had been told what their council does with their personal data.
What we found in Cardiff: Skills & capacity

Ensuring adequate resources and sufficient capacity are on-going challenges for all local authorities. Data tool respondents at the Authority cited a resources and skills shortage in data analytics as one of the biggest challenges they face. Over half of respondents to the data tool do not believe the Authority invests sufficient financial and human resources to ensure it can use data effectively.

Local authorities who exhibit greater levels of maturity in data management have integrated critical corporate functions such as information governance, business improvement and policy development. Mapping staff who have a role in analysing and managing data to build and develop capacity in data usage and developing its data analysis capacity within existing resources will help the Authority embed data driven decision-making and generate greater insights into customer demand for services.

Investing to make better use of data will result in better outcomes for citizens and create long term efficiencies for the Authority. The Well-being of Future Generations (Wales) Act 2015 provides the perfect impetus for the Authority to think long-term.

What we found in Cardiff: Evidence-based decisions

More than ever, local authorities have a need to analyse data and have available robust evidence to inform decisions. The Authority has already taken steps in this direction and data tool respondents cite their effective use of data to track key performance and manage budgets in Communities and Housing, and Adult Services. Respondents highlight other examples of effective use of data, such as its use of customer opinion data, frontline services transactional data and financial expenditure to inform its decision making process.

Nonetheless, data tool respondents have a difference of opinion about whether the Authority uses data to inform decisions and whether this is thoroughly embedded within the culture of the Authority. Respondents to the data tool highlighted challenges in this area, for instance in ‘not being able to change plans, in the light of negative data’. The Authority should set data reporting standards to ensure the data that is presented to decision makers is accessible, easily understandable and supports decision makers to fulfil their responsibilities.
Part 3 – Good practice examples for councils to learn from

Our national study report identifies some good practice in how organisations use data across the UK. Some of these examples are included below. You can see the full list of good practice in our national study report on our website audit.wales.

**Single ‘Gateway’ to Local Authority services**

The London Borough of Camden has developed a Residents Index (CRI) uniting information from multiple council data sources to create a single, consistent view of residents across the borough and the council services that they are accessing. In doing this, Camden united previously siloed information into a 360-degree view of residents’ service engagement. There have been several positive outcomes from the creation of the CRI, including:

- helping to identify cases of illegal subletting of council housing and in identifying cases of school admissions fraud, thus ensuring that valuable resources go to the residents eligible for them;
- enabling the Electoral Services team to maintain an accurate register of electors in the borough. The CRI could validate 80% of data from the electoral roll (which is higher than the 50% rate of the Department for Work and Pensions, which usually validates the council’s electoral data); and
- providing critical information to support the council’s Multi Agency Safeguarding hub to identify changes in the composition of households of vulnerable children.

**Developing data leadership into organisational transformation**

Carmarthenshire County Council’s Digital Transformation Strategy 2017-2020 recognises appropriate digital technology is needed for the council to save money and improve services by collaborating with partners seamlessly by sharing and using good quality data. The Council recognises that central to improving access to services and supporting the move towards the generation of more open data is building public confidence in robust information security that protects citizen and business data from misuse and cyber threats.
**Capacity building to drive a more collaborative culture**

Digital Flintshire 2017 – 2022 outlines how Digital Information and Technology will be used to support the County Council’s Improvement Priorities and strategic plans over the next five years. What makes Digital Flintshire different from other strategies is the focus on improving the local digital infrastructure, and in ensuring customers have the digital skills to access services and information online. This includes working with local training providers, partners and the third sector to identify and deliver effective customer training to ensure take up of digital services and support inclusion.

**Safe and secure data sharing**

The Conwy and Denbighshire Public Service Board (PSB) has developed a range of information and policies to encourage safe and secure data sharing amongst constituent partners. The PSB has built on the previous work of the Local Services Board and an Information Strategy and Information Sharing Toolkit. Training material focuses on lawful data sharing including the Wales Accord on the Sharing of Personal Information (WASPI) and the development of a range of information sharing protocols and products. As a result, the PSB is more able to demonstrate how it has used good quality data to derive its strategic priorities for Good Mental Well-being for All Ages; Community Empowerment; and Environmental Resilience. A realistic discussion about the PSB’s role was agreed which is to provide leadership and scrutiny within existing structures, rather than manage projects and integrate services delivery.
Using open data to build community capacity and drive economic wellbeing

Data Mill North is a collaborative project originally set up to tackle the challenge of increasing demands and decreasing resources in Leeds. The aim is to enable people and organisations to explore the different complex relationships between the city’s services and businesses, by collecting Open Data from multiple sources in a single hub, offering a greater insight into the workings of the city than ever before. The project’s three top priorities are to visibly improve health & wellbeing, drive more housing growth & standards and improve travel & transport infrastructure. Data Mill North is now the single repository in the region for all public services to share data, insight and intelligence on a wide range of topics including local public services, detailed business and economic performance and opportunities, adult education, and a high number of datasets and sources of housing information.

The project founders are supporters of the Open Data Institute HQ which was established in November 2013. ODI Leeds works to bring social, environmental, and economic value in Leeds by improving data literacy and skills development. To date the project has hosted 668 events, raised an additional £883,000 in funding and helped 228 people find better paid jobs. All data sources in the Yorkshire are currently being mapped – including the private, public and voluntary sector.

Data driven decision making to mobilise resources

London Fire Brigade (LFB) operates from more than 100 fire stations across London, and is the busiest fire and rescue service in the UK. LFB developed a Dynamic Cover Tool (DCT) with a private sector provider to assist decision-making in emergency service control rooms. The DCT helps to improve incident and risk coverage and ensures resources are used as efficiently as possible. Dynamic cover is the process of relocating available resources to maintain appropriate standards of risk and response cover across an area. DCT software provides a real-time visual aid to support the emergency control officer in moving emergency response vehicles.
